

Rail

Application Cataloguing & DR Backup Assessment

Denver's heritage in the Resources and Energy sectors enables us to work at speed to establish your Rail Application Health, identifying areas of concern.

Our Maturity and experience with Operational Technology (OT) & Rail environments, means **we understand how the various rail systems fit together**, and what differs from a traditional ICT or OT environment.

Cataloguing

The cataloguing of all applications and systems used in the rail network and categorising as **Vital/Non-Vital**. Focusing on Backup and DR capabilities.

We work closely with Rail team for guidance and input.

Application & System Details

Each application is further detailed to document the operating environment, location and **existence of DR and/or backup procedures** including **evidence of testing and monitoring**.

On-site visits to the Operations Centre and Railyards is recommended.

CER Mapping

Identifying all applications and systems, photos are taken in CER's and matched against as built documentation to build a **full map of CER's, RBS and LOC** across the entire rail network.

These can later be used to map out primary support teams with colour coded diagrams.

Comparing and contrasting to other "known" mining organisations, we will provide a business-focused overview, recommendations and **actionable next steps on strategic, tactical and operational opportunities**.
